Statistics: Mean 36.728; Variance 180.698; scale 0.203

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

| ΡT | Human Notch and Delta DNA and protein sequences - used for study |
| PΤ | and manipulation of differentiation processes |
| PS | Claim 50; Fig 13; 239pp; English. |
| င္ပ | The sequence given is encoded by the nucleotide sequence of human |
| ဂ | Delta gene contained in plasmid cDNA clone D11. A human expression |
| ဂ | library was constructed and screening assays were carried out on to |
| 유 | select for the expressed Delta product. Alternatively the sequences |
| င် | could be isolated by amplification using polymerase chain reaction |
| 8 | (PCR) primers. The isolated gene may be inserted into a cloning |
| 3 6 | vector and expressed. The Delta gene and also the Notch and Serrace |
| 3 6 | they encode are involved in specific home- or beterotypic interactions |
| ဂ | crucial to differentiation. The quantitation of mRNA for human Notch |
| ဂ | and Delta and adhesive molecules, and study of its expression are |
| င္ပ | possible using the DNA and antibodies raised against the Notch and |
| 8 | Delta proteins. |

C-delta-1 polypeptide (W11719) is the chick homologue of Drosophila Delta-1 polypeptide (W11719) is the chick homologue of Drosophila Delta-1 aprotein that binds to Notch protein. Expression of amino acid sequence was deduced from a cDNA clone (T58897) obtd. From chick stage 4-6 embryos. An alternatively spliced variant (W00876) was also isolated, and mouse (W11720) and human (W1171-38) Delta-1 polypeptides have been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon cancer, melanoma or seminoma, and nervous system disorders or to Sequence 727 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

C delta-1 polypeptide (W00076) is the chick homologue of Drosophila
C delta-1 protein that binds to Notch protein. Expression of
C delta, a protein that binds to Notch protein. Expression of
C delta, a protein that binds to Notch protein. Expression of
C delta-1 correlates with onset of neurogenesis. The C-delta-1
C from chick stage 4-6 embryos. A shorter version (W58877) of
C delta-1, lacking the 12 C-terminal amino acids of the longer
C version, was also isolated, and mouse (W11720) and human (W11721-
C 38) Delta-1 polypeptides have been identified. Delta-1 proteins
C can be used to treat or prevent disorders characterised by
C increased Notch activity, such as cervical, breast, lung or colon

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated
                                                   21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11-FEB-1998 (first entry)
Proliferation and differentiation suppression polypeptide.

                                         Claim 4; Fig 8; 135pp; English.

M-delta-1 polypeptide (W11720) is the mouse homologue of Drosophila Delta, a protein that binds to Notch protein. It is expressed primarily in presomitic mesoderm, the central and peripheral nervous systems, and kidney. Chick (W11719) and human (W11721-38) Delta-1 polypeptides have also been identified. Delta-1 proteins can be used to treat or prevent disorders characterised by increased Notch activity, such as cervical, breast, lung or colon
                                                                                                                                                                                                                                                                  N-PSDB; T58899.

Disclosure; Page 112-115; 161pp; English.

Chicken Serrate (WDS83), or C-Serrate, is a ligand for the zygotic neurogenic locus Notch and is believed to play a major role in determining cell fates in the central nervous system. Its amino acid sequence was deduced from a cDNA clone (T40092) obtid. from an optic explant cDNA library. C-Serrate is expressed in the central nervous system, cranial placodes, nephric mesoderm, vascular sequence 1193 AA; 234 qycdkciphpgcvhgtciepwqclcetnwggqlcdkdlnycgthppclnggtcsntgpdk 375 VLTCSDKPC-HQGICRNVRPGLGSKGQGYQCECPIGYSGPNCDLQLDNCSPNPCINGGSC dinecasnpcmngghcqdeingfqclcpagfsgnlcqldidycepnpcqngaqcfnlamd qvasasgqfeleilsvqnvngvlqngnccdgtrnpgdkkctrdecdtyfkvclkeyqsrv 174 crprddffthhtcdqngnktclegwtgpecnkaicrqgcspkhgsctvpgecrcqygwqg 349 iddcspnpcghggtcqd----l-v--dgfkcicppqwtgktcqldanecegkpcvnansc ä Indels 28; Ish-Horowicz Length 1193;

Claim 4: Page 95-98; 161pp; English.

Human Serrate-1 (W05833) and human Serrate-2 (W05833) are ligands for the zygotic neurogenic locus Notch, and are believed to play a major role in determining cell fates (differentiation) in the central nervous system. Their amino acid sequences were deduced from CDNA clones (see also T40090-91) isolated from human foetal brain cDNA libraries. The proteins, antibodies raised to them, and encoding nucleic acids can be used in the detection of serrate sequences and in the treatment of disorders of cell fate

The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement oblood formation, e.g. after immunosuppression.
                                                                                                                                                                                                                                       Length 1218;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents a polypeptide which suppresses proliferation and differentiation of undifferentiated cells such as neurons and blood cells. The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement of blood formation, e.g. after immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23 SGSFELRLKYFSNDHGRDNEGRCCSGESDGATGKCL-GSCKTRFRVCLKHYQATIDITSQ

The polypeptide may be used for the prevention and control of disorders involving undifferentiated cells, such as leukaemia and malignant tumours, and improvement cells, such as leukaemia and malignant tumours, and improvement oblood formation, e.g. after immunosuppression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proli

Two Drosophila ganomic phage libraries were screened and recombinant clones were isolated. The CDNAs in lambda gat10 were isolated from an early pupal library. The Cl CDNA was isolated from an early pupal library. Subsequently the C3 CDNA was isolated using the 5' 700 bp terminal fragment of the C1 CDNA as probe. The complete 5561bp

                                                                                                                                                                                                                                                                                                Gaps
          Vertebring Sorrate protein and related DNA - used to treat or prevent malignancies characterised by increased Notch activity. Claim 5; Page 104-107; 161pp; English.

Human Serrate-1 (W0583) and human Serrate-2 (W05833) are ligands for the zygotic neurogenic locus Notch, and are believed to play a major role in determining cell fates (differentiation) in the central nervous system. Their amino acid sequences were deduced from CDNA clones (see also T40090-91) isolated from human foetal and encoding nucleic acids can be used in the detection of Serrate sequences and in the treatment of disorders of cell fate
                                                                                                                                                                                                                                                                                                                                                                                                              224 DYCHIPKCAKGCE--HGHCDKPNQCVCQLGWKGALCNECVLEPNCIHGTCNKPWTCICNE

sequence of DNA of the Drosophila Serrate protein was derived from C1 and C3 cDNAs (Q43910). The deduced protein product appears to be a transmembrane protein. AAs 51-80 represent the likely signal peptide; ass 542-564 represent potential membrane associated region; ass 1221-1245 represent the putative transmembrane domain. Sequence 1404 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 aphsagiaanalltttataiigsnlsstallaaltsavastslaigpcinakecrnqpgs
